

# **Tries & Binary Search Trees Applied Algorithms**

# Tries

- A trie is a tree-based data structure for storing strings in order to support fast pattern matching.
- The main application domain is information retrieval.
- Video: <https://www.youtube.com/watch?v=-urNrIAQnNo>

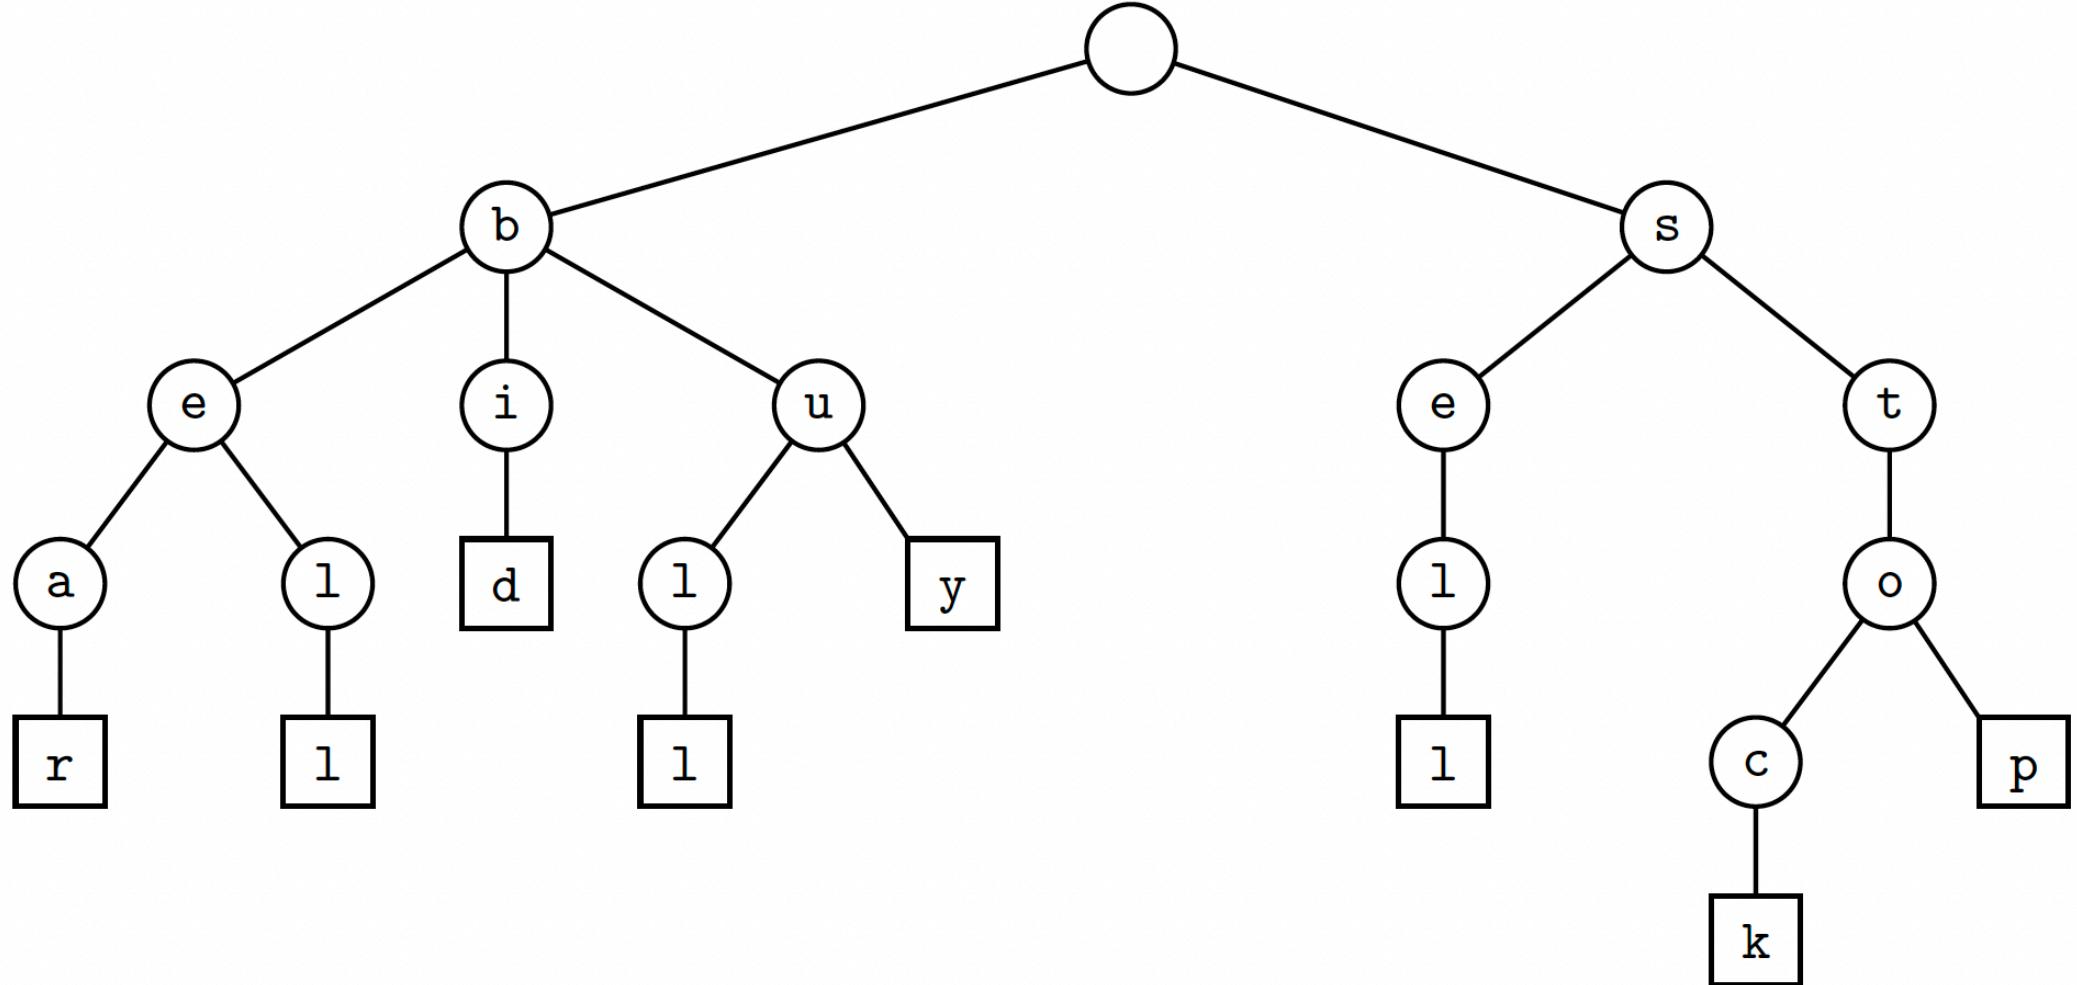

# Standard Tries

- $\Sigma$  : an alphabet
- $S$ : a set of  $s$  strings. There are none string whose prefix of another string in  $S$ .
- The properties of a standard trie for  $S$  (an ordered tree) as follows:
  - Each node of the tree is labeled with a character in  $\Sigma$  (except the root.)
  - The children of an internal node of the tree have distinct labels.
  - Tree has  $s$  leaves. The path from the root to a leaf yields the string of  $S$ .

# Standard Tries

- ▶ The tree has at most  $n+1$  nodes
- ▶ Each internal node has at most  $|\Sigma|$  children.
- ▶ The height of the tree is equal to the longest string in  $S$ .

# Example: Standard Tries

Standard trie for the strings {bear, bell, bid, bull, buy, sell, stock, stop}.

# Standard Tries

- The search for a string of length  $m$  is in  $O(m |\Sigma|)$  time—visiting at most  $m+1$  nodes and spending  $O(|\Sigma|)$  time at each node. “But, typically expect a search for a string of length  $m$  to run in  $O(m)$  time”.
- The running time to insert: worst-case  $O(m|\Sigma|)$ , expected  $O(m)$  if using secondary hash tables at each node.
- Constructing the entire trie takes expected  $O(n)$  time ( $n$ : the total length of the strings of  $S$ ).

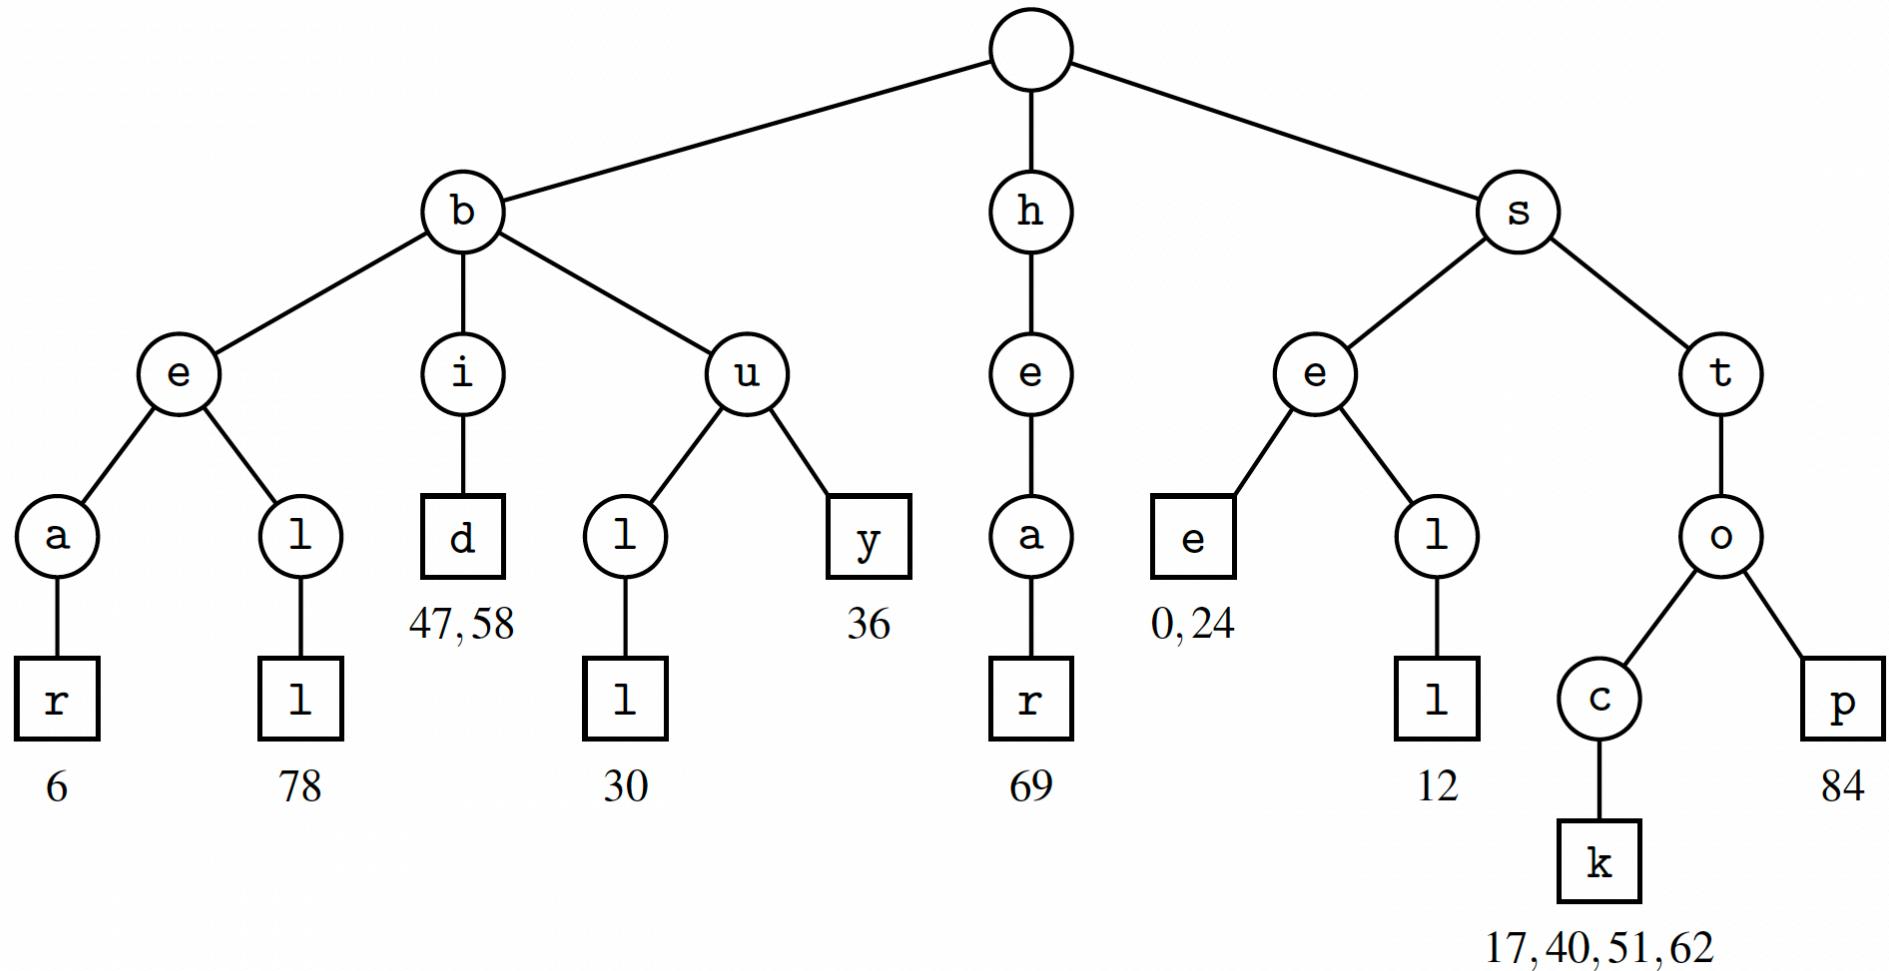

# Example: Standard Tries

- Word matching with a standard trie (exclude stop words).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22
s	e	e		a		b	e	a	r	?		s	e	l	l		s	t	o	c	k	!
23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45
	s	e	e		a		b	u	l	l	?		b	u	y		s	t	o	c	k	!
46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68
	b	i	d		s	t	o	c	k	!		b	i	d		s	t	o	c	k	!	
69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88			
h	e	a	r		t	h	e		b	e	l	l	?		s	t	o	p	!			

# Example: Standard Tries

- Word matching with a standard trie:

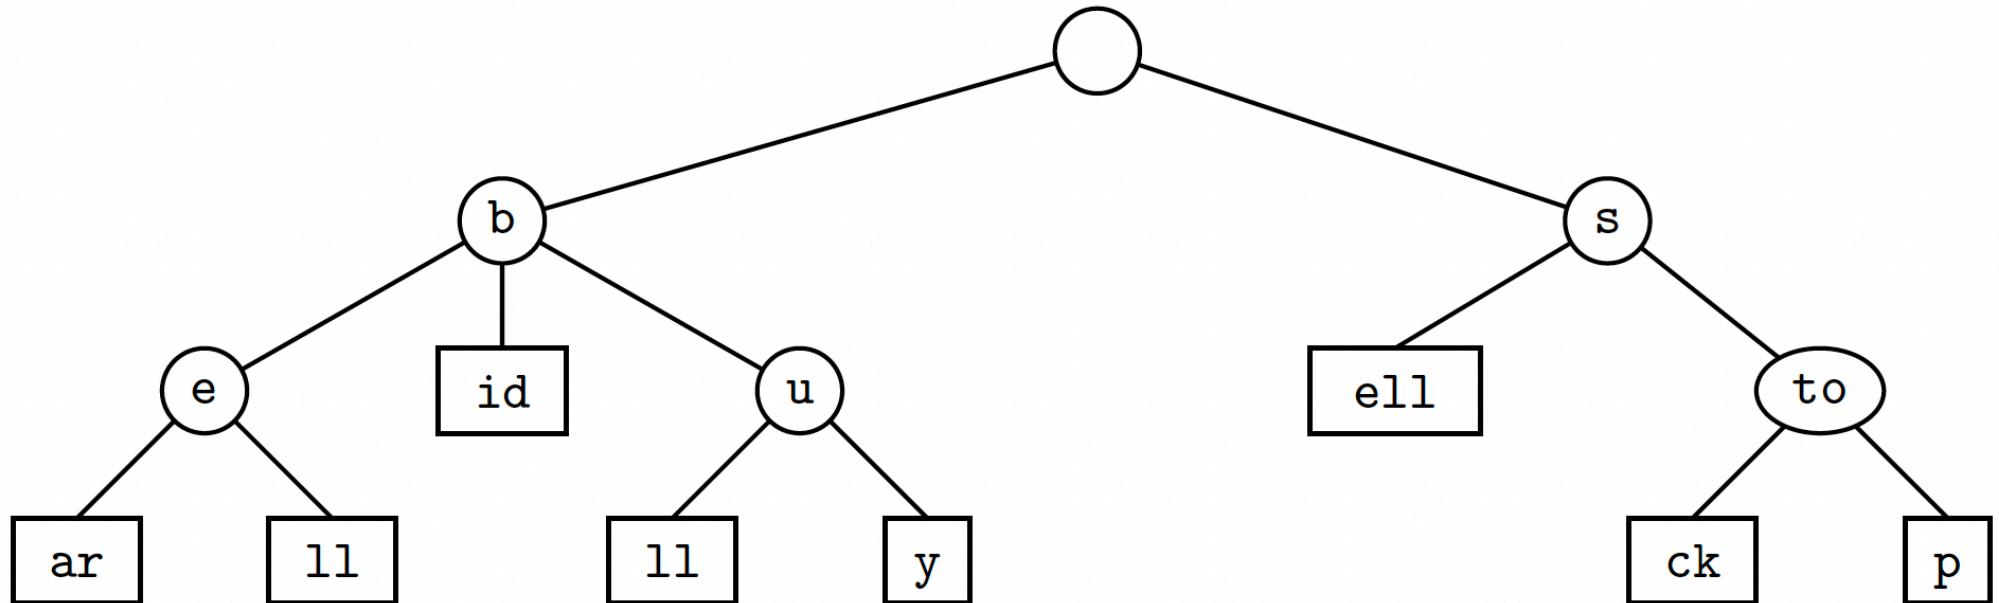

# Compressed Tries

- There is a potential space inefficiency in the standard trie—a lot of nodes that have only one child.
- A compressed trie stores  $s$  strings from an alphabet of size  $d$  and has the following properties:
  - Every internal node has at least two children and most  $d$  children.
  - Tree has  $s$  leaves nodes.
  - The number of nodes of the tree is  $O(s)$ .

# Example: Compressed trie

- Compressed trie for the strings {bear, bell, bid, bull, buy, sell, stock, stop}.

# Compressed Tries

- “A compressed trie is advantageous only when it is used as an auxiliary index structure over a collection of strings already stored in a primary structure, and is not required to actually store all the characters of the strings in the collection.”
- Video: [https://www.youtube.com/watch?v=lgc3\\_xaj4kE&t=0s](https://www.youtube.com/watch?v=lgc3_xaj4kE&t=0s)

# Example: compressed trie

- Collection S of strings stored in an array:

	0	1	2	3	4
$S[0] =$	s	e	e		
$S[1] =$	b	e	a	r	
$S[2] =$	s	e	l	l	
$S[3] =$	s	t	o	c	k

	0	1	2	3
$S[4] =$	b	u	l	l
$S[5] =$	b	u	y	
$S[6] =$	b	i	d	

	0	1	2	3
$S[7] =$	h	e	a	r
$S[8] =$	b	e	l	l
$S[9] =$	s	t	o	p

# Example: compressed trie

- Compact representation:

# Example: compressed trie

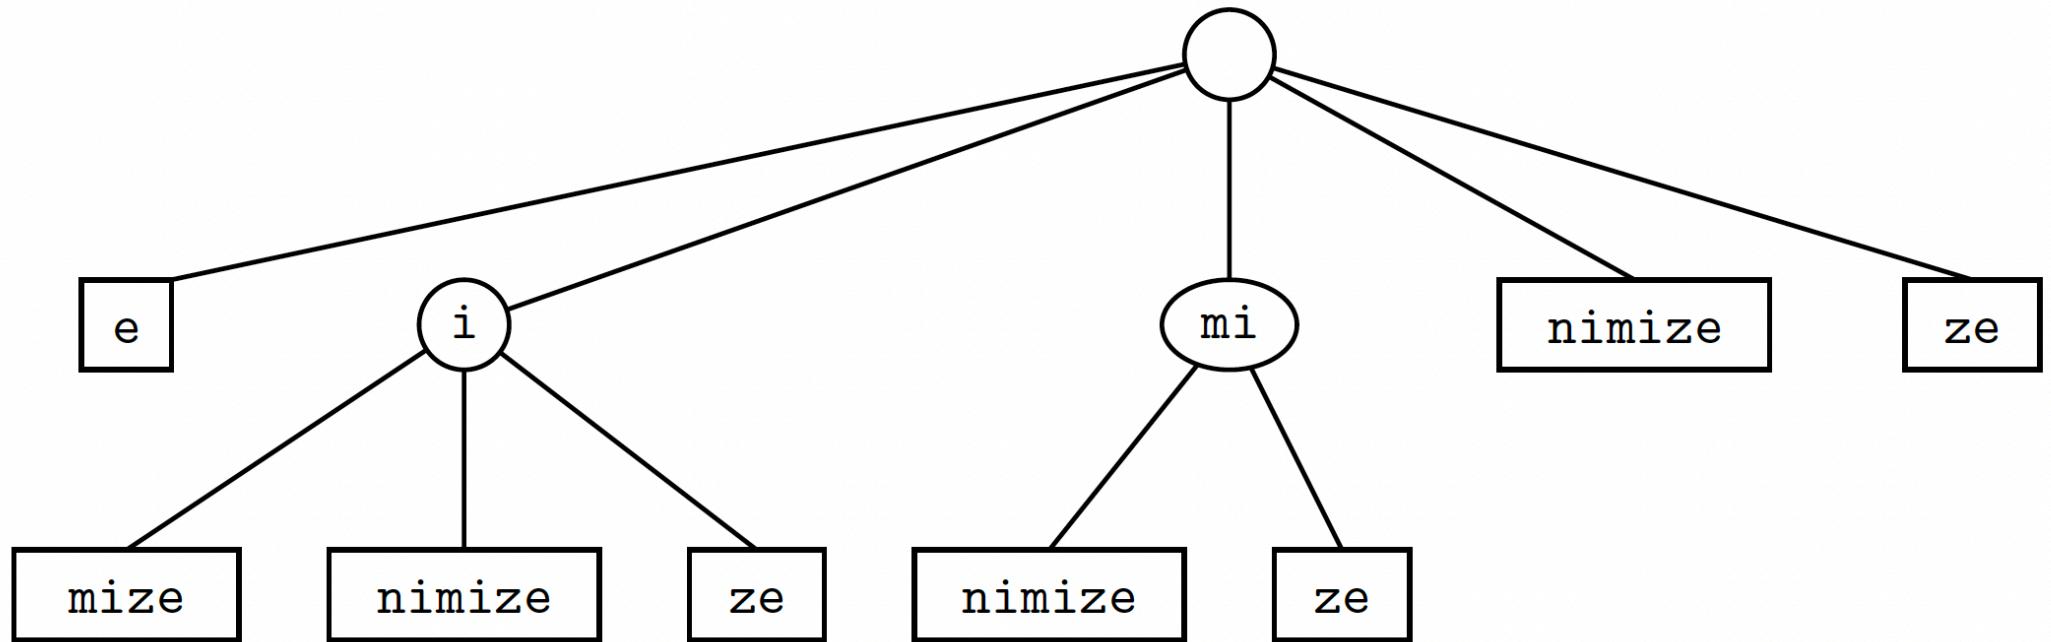

- The total space from  $O(n)$  for the standard trie to  $O(s)$  for the compressed trie ( $n$ : the total length of the strings in  $S$ ,  $s$ : the number of strings in  $S$ ).
- “Searching in a compressed trie is not necessarily faster than in a standard tree, since there is still need to compare every character of the desired pattern with the potentially multi-character labels while traversing paths in the trie.”

# Suffix Tries

- S includes all the suffixes of a string X. Such a trie is called the suffix trie
- The compact representation of a suffix trie uses  $O(n)$  space ( $|X| = n$ )
- The construction takes  $O(|\Sigma|n^2)$  time. However, the compact suffix trie can be constructed in  $O(n)$  time.
- Video: <https://www.youtube.com/watch?v=ddPQKSk5W6Y>

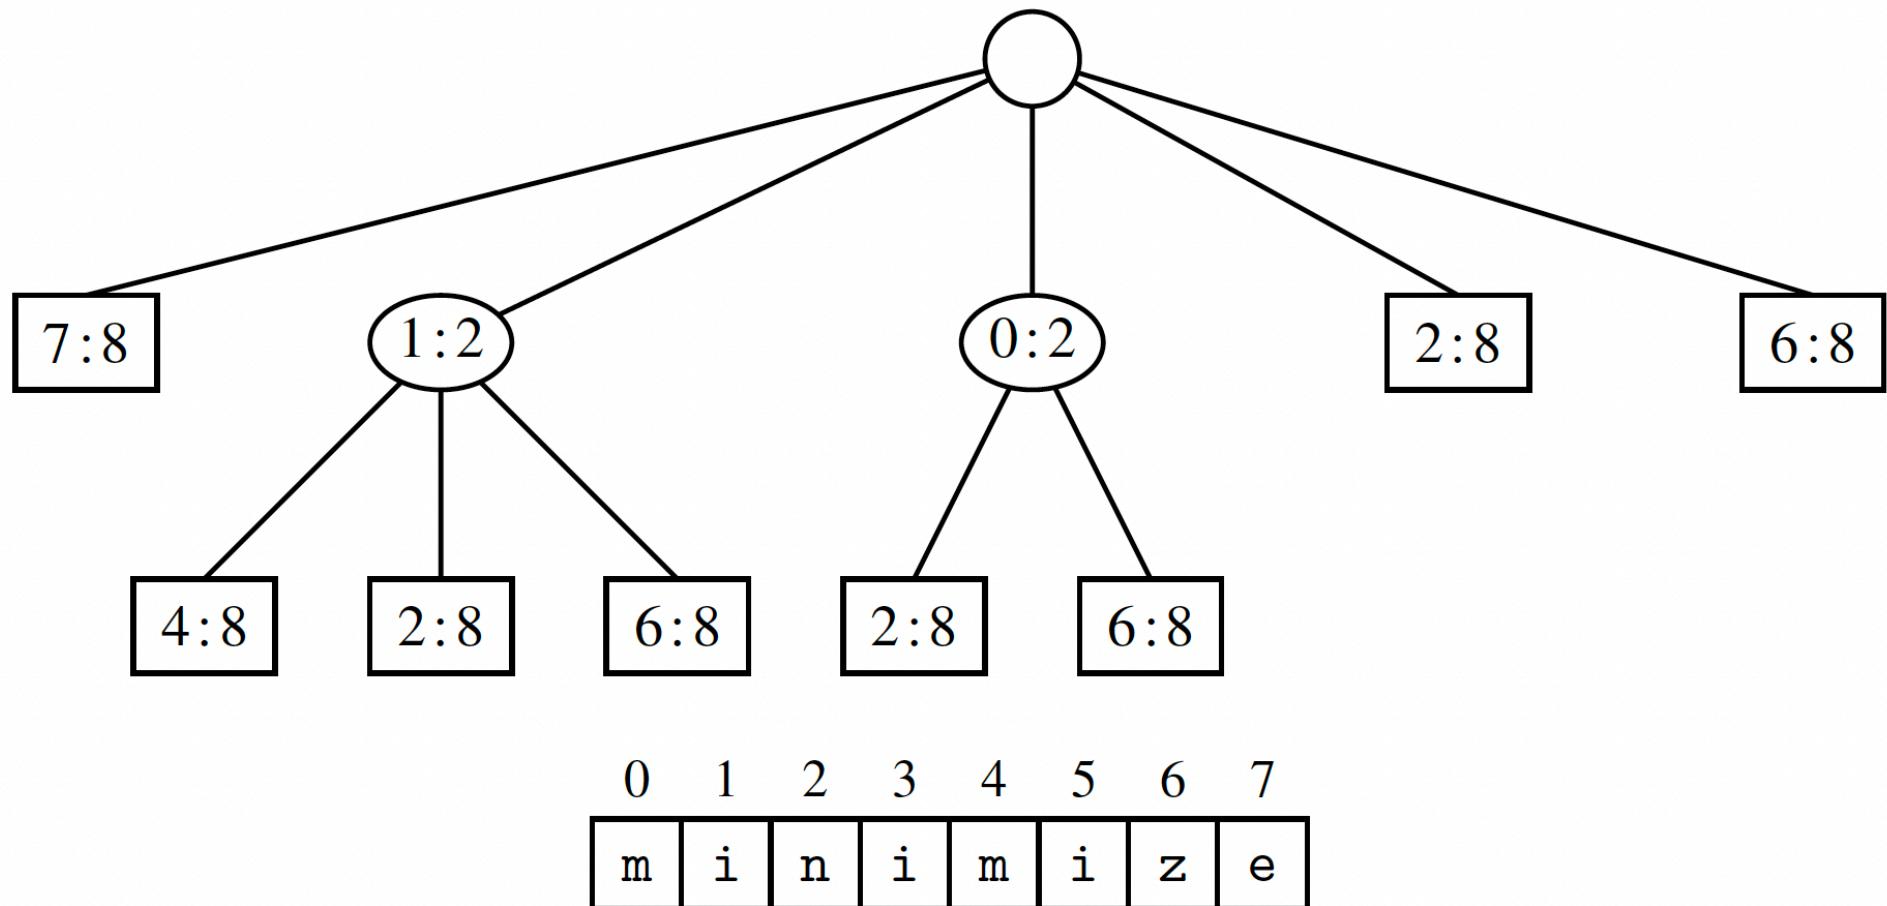

# Example: Suffix Tries

- String X = “minimize”.

# Example: Suffix Tries

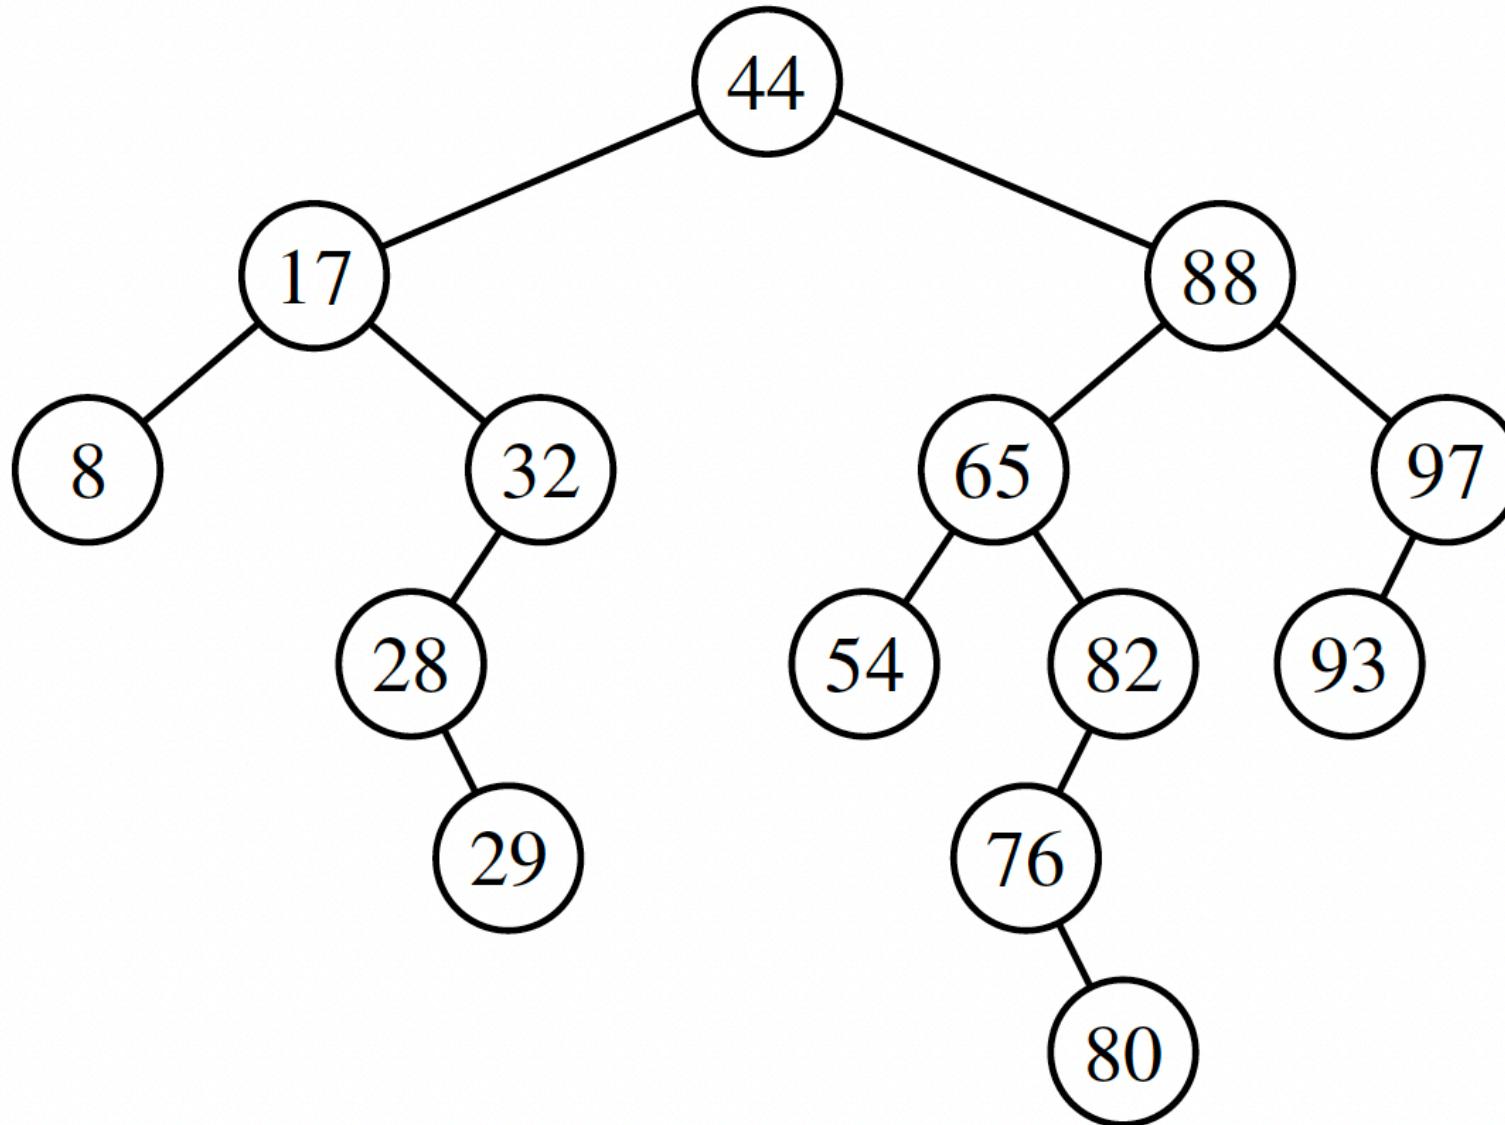

- Compact representation:

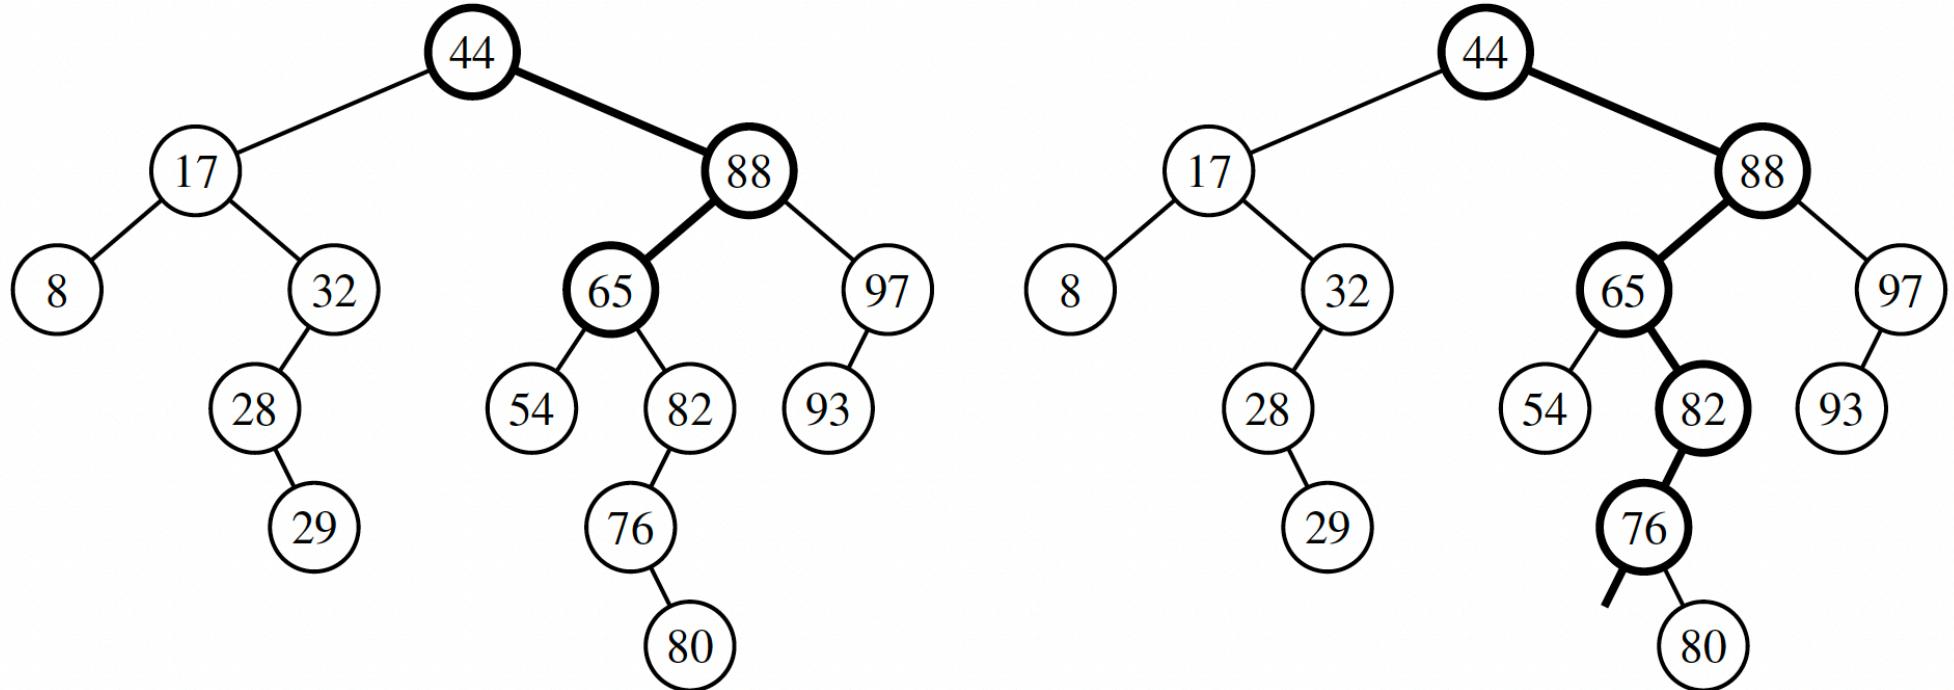

# Binary Search Trees

- “A binary search tree is a binary tree and each position p storing a key-value pair (k,v) such that:
  - Keys in the left subtree of p are less than k.
  - Keys in the right subtree of p are greater than k.”
  - Video: <https://www.youtube.com/watch?v=mtvbVLK5xDQ>

# Binary Search Trees: Example

# Searches

Search: key 65

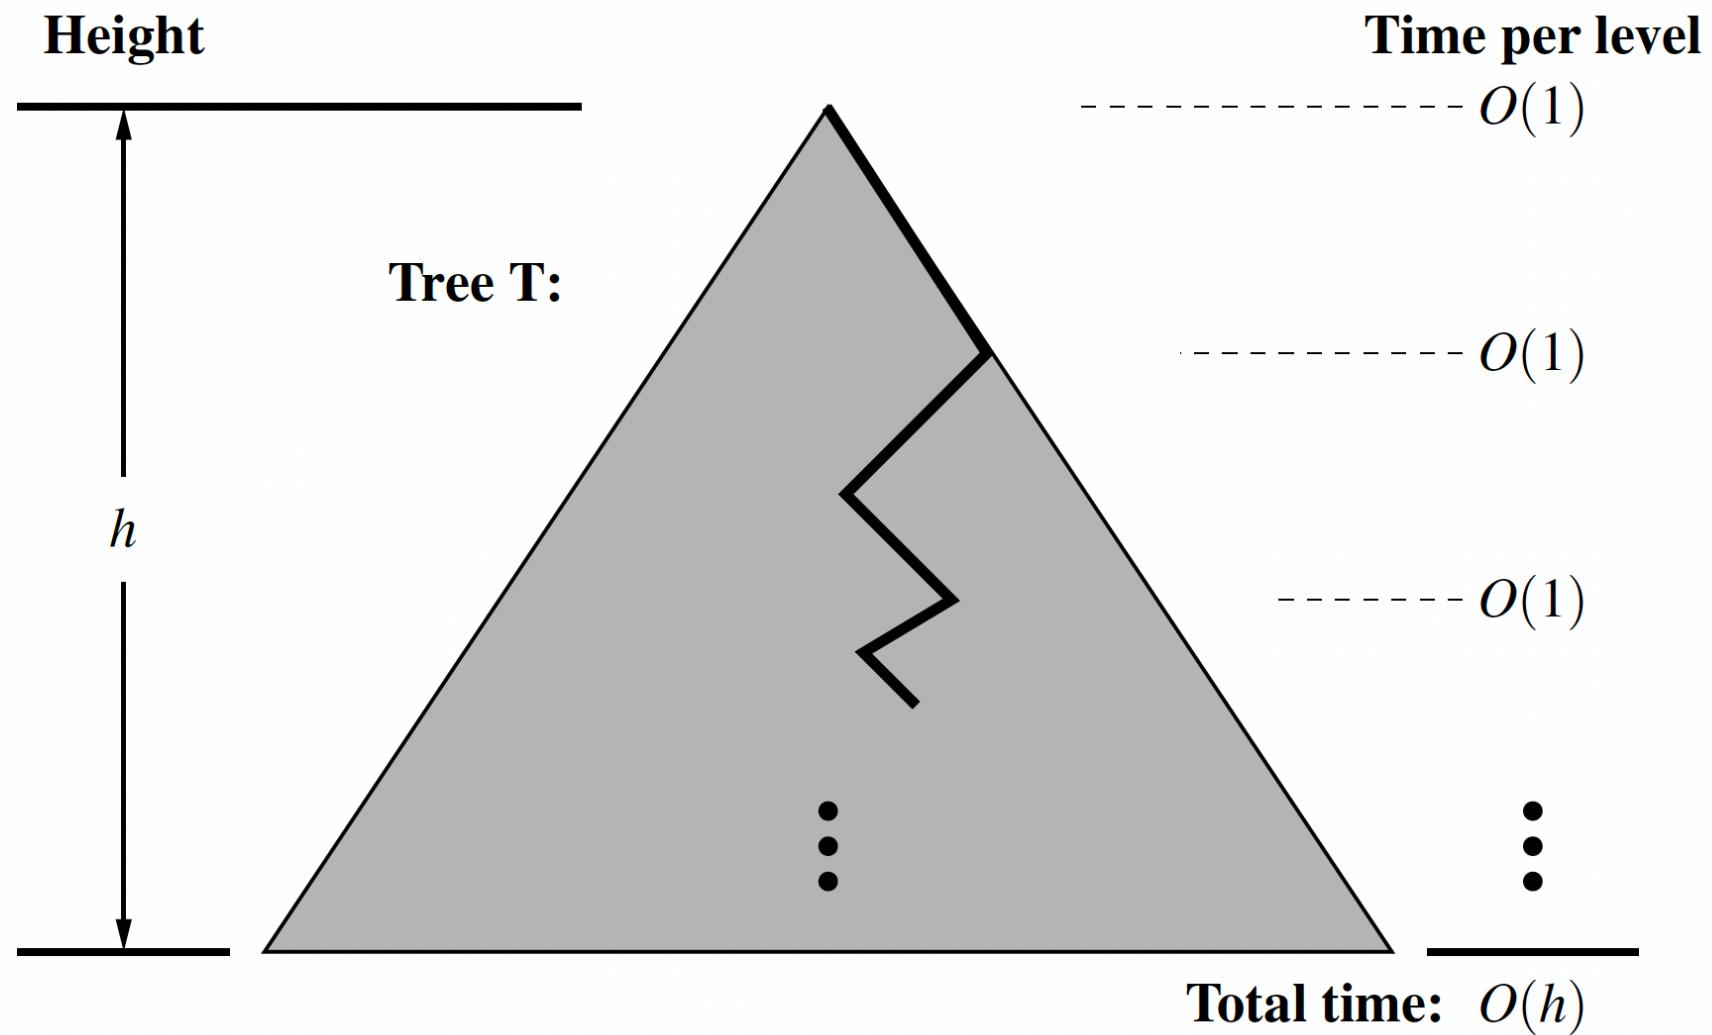

# Searches

**Algorithm** TreeSearch( $T$ ,  $p$ ,  $k$ ):

```
if  $k == p.key()$  then  
    return  $p$                                 {successful search}  
else if  $k < p.key()$  and  $T.left(p)$  is not None then  
    return TreeSearch( $T$ ,  $T.left(p)$ ,  $k$ )      {recur on left subtree}  
else if  $k > p.key()$  and  $T.right(p)$  is not None then  
    return TreeSearch( $T$ ,  $T.right(p)$ ,  $k$ )     {recur on right subtree}  
return  $p$                                     {unsuccessful search}
```

Recursive search in a binary search tree.

# Searches

# Insertion

**Algorithm** TreeInsert( $T, k, v$ ):

*Input:* A search key  $k$  to be associated with value  $v$

$p = \text{TreeSearch}(T, T.\text{root}(), k)$

**if**  $k == p.\text{key}()$  **then**

    Set  $p$ 's value to  $v$

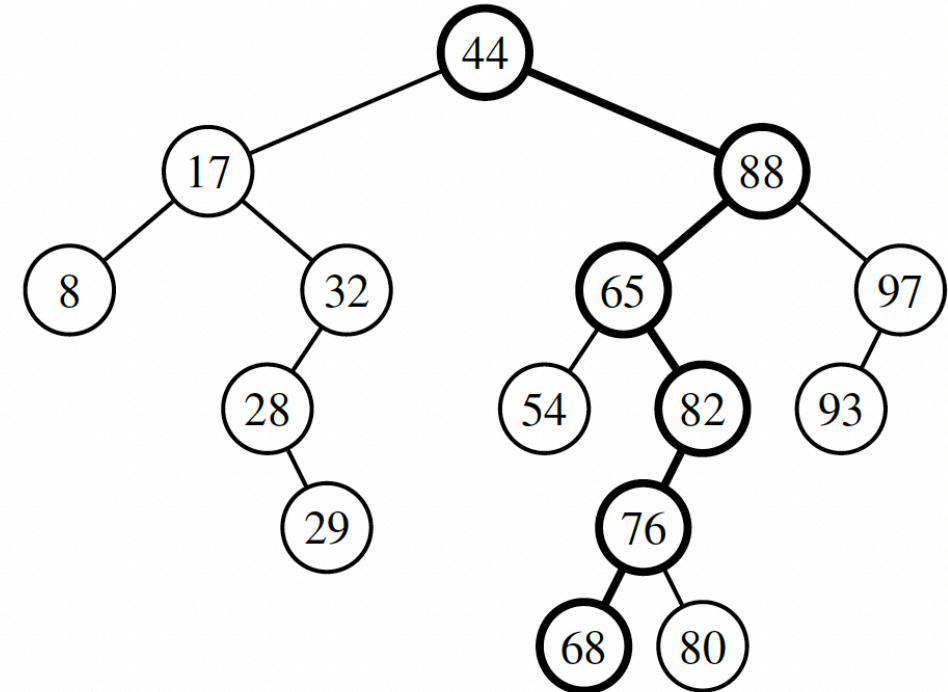

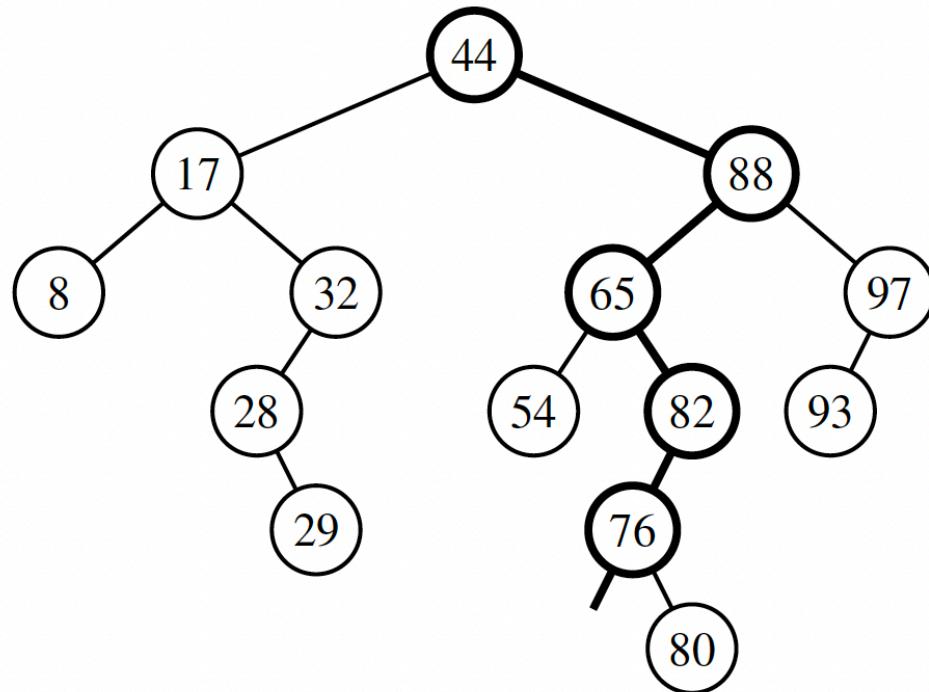

**else if**  $k < p.\text{key}()$  **then**

        add node with item  $(k, v)$  as left child of  $p$

**else**

        add node with item  $(k, v)$  as right child of  $p$

# Insertion: Example

Insertion: key 68

# Deletion

**Algorithm** TreeInsert( $T, k, v$ ):

***Input:*** A search key  $k$  to be associated with value  $v$

$p = \text{TreeSearch}(T, T.\text{root}(), k)$

**if**  $k == p.\text{key}()$  **then**

    Set  $p$ 's value to  $v$

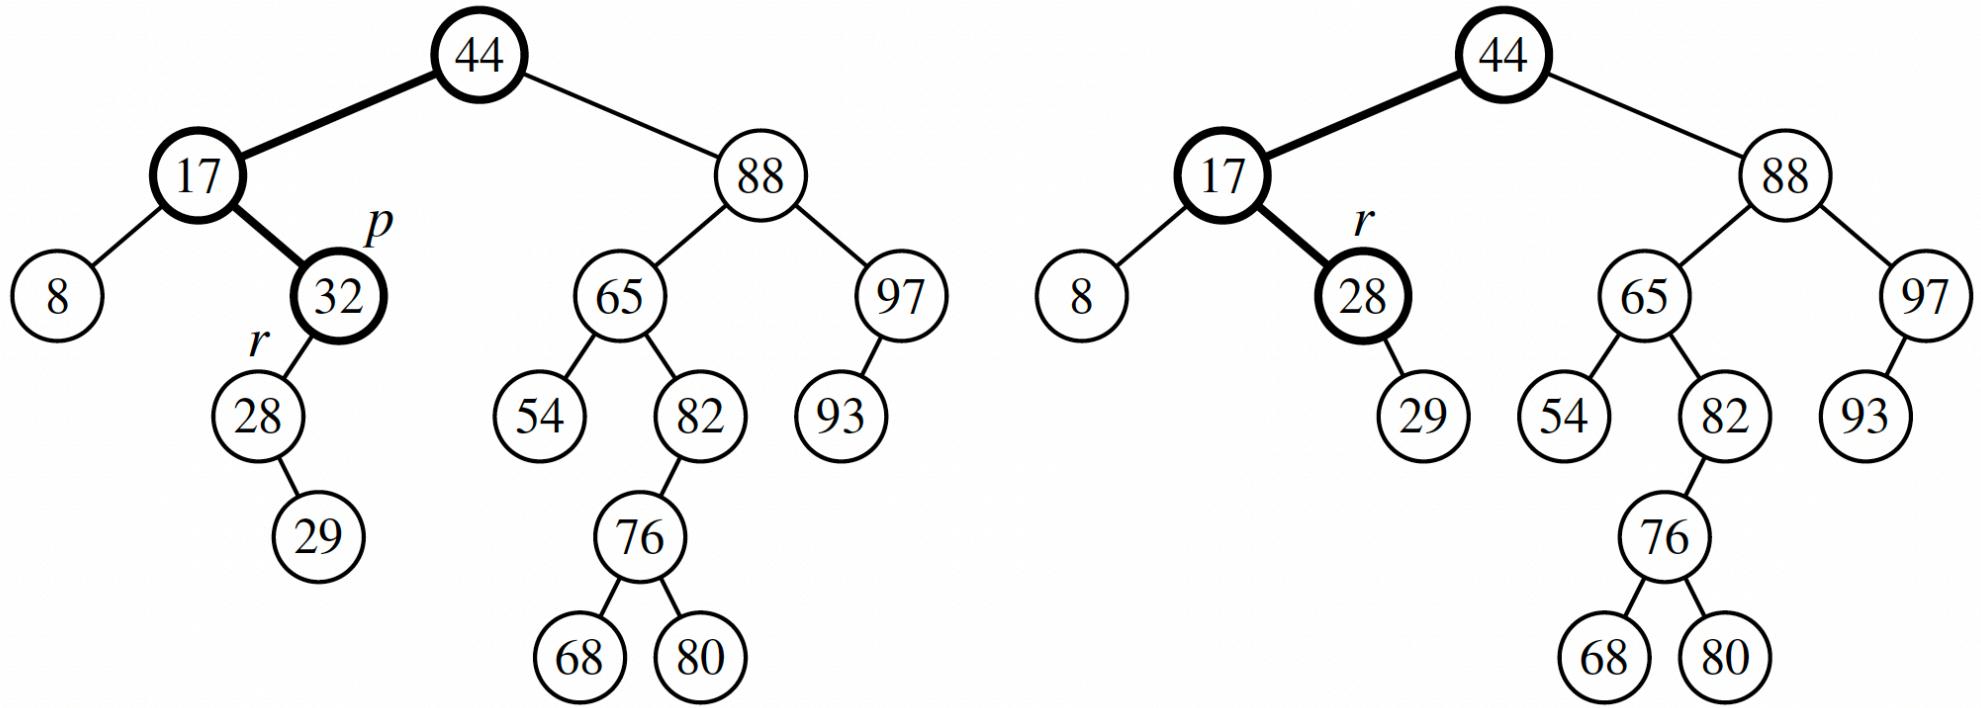

**else if**  $k < p.\text{key}()$  **then**

        add node with item  $(k, v)$  as left child of  $p$

**else**

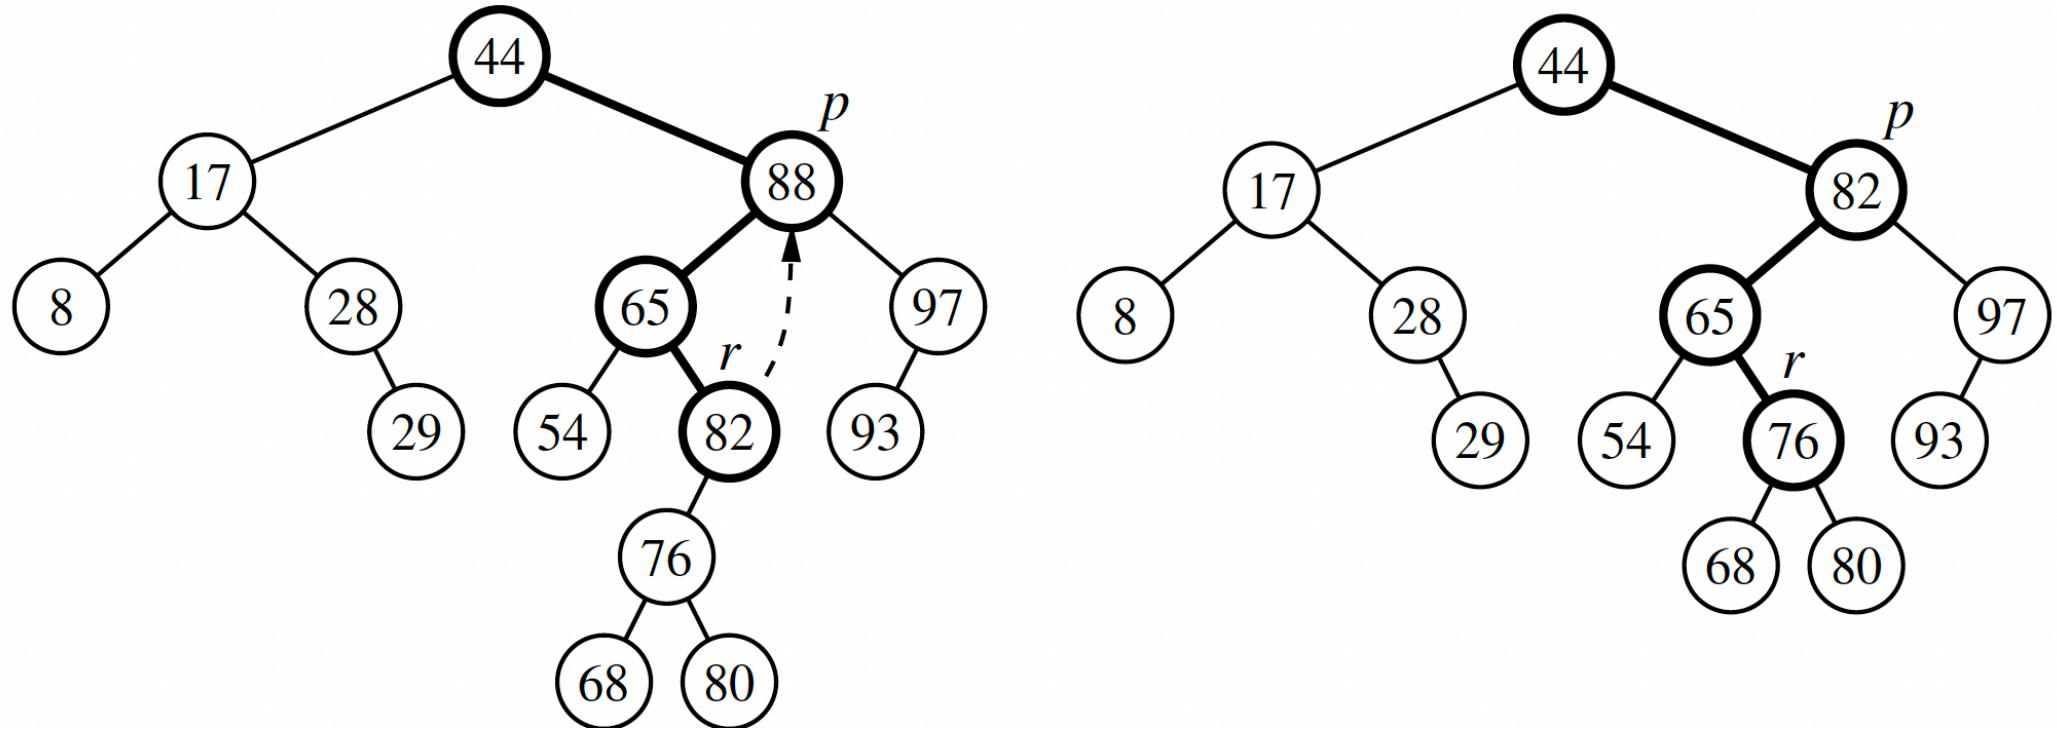

        add node with item  $(k, v)$  as right child of  $p$

# Deletion: Example

Deleting key 32

# Deletion: Example

Deleting key 88
